1. Round 1

1.1. Reviewer 1

Reviewer:

This article contributes valuable insights into the psychological aspects of sexual satisfaction within intimate relationships. By addressing the suggested areas for improvement, future research can build on these findings to develop targeted interventions and further our understanding of the complex dynamics influencing sexual well-being.

The cross-sectional design limits the ability to infer causality. Future research could benefit from longitudinal studies to explore these relationships over time.

The article suggests the potential for interventions but does not provide specific recommendations or frameworks for developing such interventions. Future work could focus on creating and empirically testing interventions aimed at enhancing resilience and thought control within the context of sexual satisfaction.

1.2. Reviewer 2

Reviewer:

While the study includes a diverse sample, further research could explore these relationships across different cultures, sexual orientations, and relationship types to enhance generalizability.

Expanding on the theoretical underpinnings of how resilience and thought control interact with sexual satisfaction could enrich the discussion. Incorporating models or theories from positive psychology or cognitive-behavioral therapy might provide deeper insights into the mechanisms at play.

The discussion of limitations is brief. A more thorough examination of the limitations and their implications for the study's findings would strengthen the research's transparency and reliability.

Response: Revised and uploaded the manuscript.
