1. Round 1

1.1. Reviewer 1

Reviewer:

Expanding the sample to include a wider demographic range and possibly increasing the sample size could enhance the study's generalizability. Exploring these constructs in diverse cultural contexts would also add valuable insights.

Adopting a longitudinal design could help in understanding the temporal dynamics between wisdom, experiential avoidance, and relationship satisfaction. This approach would allow for a more nuanced exploration of causal relationships.

While the study controls for several demographic variables, exploring additional factors such as personality traits, mental health status, and relationship length could offer a more detailed analysis of the influences on relationship satisfaction.

1.2. Reviewer 2

Reviewer:

The study's integration of wisdom and experiential avoidance within the context of relationship satisfaction offers a novel perspective. It enriches the literature by exploring underexamined psychological constructs that influence romantic relationships.

Future research could focus on developing and testing interventions aimed at enhancing wisdom and reducing experiential avoidance. This would provide practical applications for the findings and contribute to the development of evidence-based relationship enhancement strategies.

Further elaboration on the theoretical underpinnings that link wisdom with experiential avoidance and relationship satisfaction would deepen the understanding of these interactions. Incorporating additional psychological theories could offer a more comprehensive framework.

Response: Revised and uploaded the manuscript.
